Continuous Compliance in DevSecOps - The Resolution Life US Story

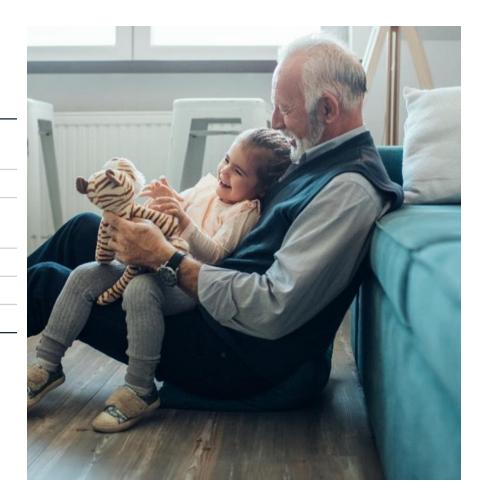

October 3, 2023

Agenda for today

- Software delivery changes in the Insurance industry
- 2 Benefits/Opportunities of automation
- 3 Resolution Life US Problem Statement Overview
- 4 What is Continuous Compliance?
- 5 What did we do?
- 6 Demo: Gathr Continuous Compliance Solution

Your presenters

Mittal Bhiogade
Chief Architect,
Resolution Life US

Matthew Bonser
Director,
PricewaterhouseCoopers

Bhavin Shah SVP - Sales and Customer Success, Gathr

Key challenges for insurance industry for change management

Disparate, complex tools and processes

Uncorrelatable data

Manual requests / responses for data

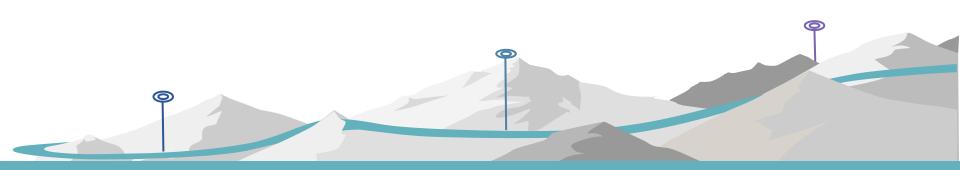

Delays in visibility of current state

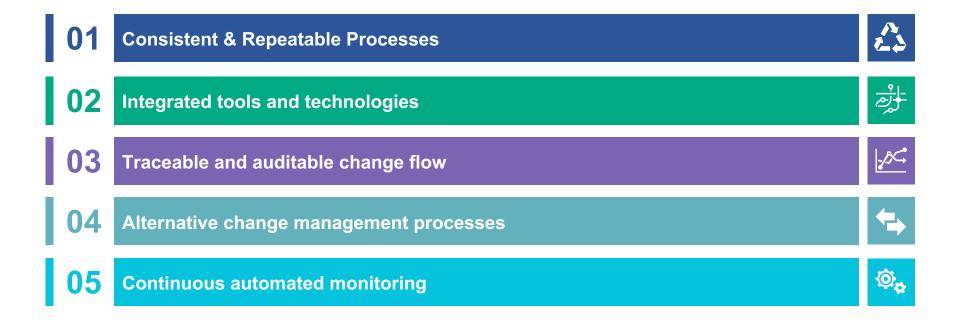

Iterative manual audit and remediation

Hard to trace source of issues quickly

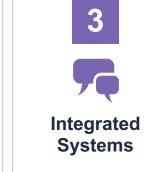

Opportunities to improve the overall change management process

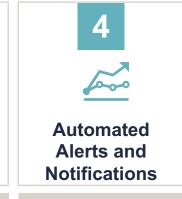

What is Continuous Compliance?

Encourage a culture of accountability and responsibility to foster awareness of compliance requirements

Adapt policies and controls based on changing regulatory requirements Ensure new code changes and updates comply with regulations while embracing DevOps and Agile methodologies

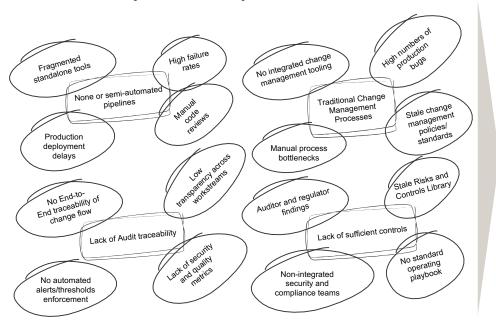

Trigger alerts to relevant stakeholders when compliance deviations are identified

Continuously monitor activities for any deviation from established compliance parameters

Compliance by Design in IT change management

Automate compliance in the technology change management process to both strengthen the environment and enhance the developer experience

Disparate, Complex Processes

Target Tech Enabled Model

Continuous compliance and monitoring through the technology change cycle

Policies, Standards & Procedures

Standard Pipeline Tools and Configurations

Operating Playbooks and Guardrails

Continuous Compliance Monitoring Tools

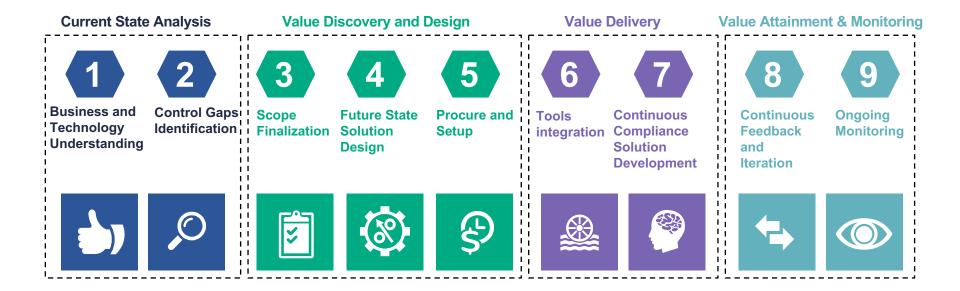

Integrating Compliance tools with DevOps toolchain

Achieving Compliance and Controls through DevSecOps Non-functional Requirements (Compliance, Control, Audit, Privacy and Information Security Teams) **End-to-End Pipeline Steps *** Quarterly product roadmap review **Continuous Continuous Integration Continuous Deployment** Planning Add non-functional requirements as user stories with detailed acceptance criteria and DoD Confirm security, privacy and controls related objectives Vision Artifact **Application Security Validation Controls** Commit Code Repository Software Composition Analysis (SCA) Performance Roadmap Triggers, Push Testing Static Application Security Testing (SAST) Deploy Integration Deploy Automated Deploy to Continuous Package to Dev Tests to QA Team Prod Monitoring Dynamic Application Security Testing (DAST) Build Backlog Interactive Application Security Testing (IAST) AS Acceptance/ Regression Other IT General Controls Ready Testina Quality Unit Tests /Security Changes are authorized by Product Owner Scans Code is reviewed by peers for quality and validity Done pipeline starts Changes are tested and meet exit criteria Validate deployed code has met quality standards and Foundational IT General Continuous All tools in the pipeline have ITGCs (change control, role-Controls Compliance based access controls, segregation of duties) (ITGCs) The control environment is continuously monitored and violations trigger remediation protocols

* Through necessity of showing a flow, this is shown as a single, linear process. In reality, certain capabilities persist throughout & the steps involved iteration

DevOps Enterprise Summit 2023 | Continuous Compliance in DevSecOps – The Resolution Life Story Sensitivity - Restricted

What did we do?

But why is all of this important, though?

Develop End-to-End Traceability

Establish a traceable end-to-end audit trail to track code changes, infrastructure changes, configurations to demonstrate compliance at any point

Reduce Cost of Audit

Reduce your cost and effort in executing cumbersome and manual audits by establishing automated monitoring and tracking of the development lifecycle

Establish Compliant Processes and Tools

Enforce automated validation and reporting of control points defined across the pipeline to ensure your systems remain compliant and in alignment with regulatory requirements

Enable Low Touch Change Flow

Introduce an alternative to traditional change management process, with end-to-end automation where possible

Continuous Compliance Solution Demo

Thank you
